

Practice Problems

Units:	energy = joules	work = joules
	Weight = newtons	power = watts
	Height = meters	acceleration = m/s ²
	Mass = kilograms	Force = newtons
	Speed = m/s	Velocity = m/s in a specific direction

Section 1: Calculating Potential and Kinetic Energy

Formula: Potential energy = weight x height (PE = W x H)

Kinetic energy = $\frac{1}{2}$ (Mass x Velocity²) or (K.E. = $\frac{1}{2}mv^2$)

1. You serve volleyball with a mass of 2.1 kg. The ball leaves your hand with a speed of 30 m/s. The ball has Kinetic energy. Calculate it.

$$KE = \frac{1}{2}(m \times v^2)$$

$$\frac{1}{2}(2.1 \text{ kg} \cdot (30 \text{ m/s})^2) = \frac{1}{2}(1890)$$

$$\frac{1}{2}(2.1 \text{ kg} \cdot 900 \text{ m/s}^2) = \boxed{945 \text{ J}}$$

2. A cinder block is sitting on a platform 20 m high. It weighs 79 N. The block has potential energy. Calculate it.

$$PE = w \times h$$

$$79 \text{ N} \times 20 \text{ m} = \boxed{1580 \text{ J}}$$

Section 2: Speed (velocity is speed with direction) and Acceleration

$$S = \frac{D}{T}$$

$$D = S \times T$$

$$T = \frac{D}{S}$$

1. Find the velocity of a truck that travels 75 miles north in 2.5 hours.

$$\frac{75 \text{ miles}}{2.5 \text{ hr}} = \boxed{30 \text{ miles per hour North}}$$

2. Find the speed of a bicyclist who took an hour and a half to travel 10 kilometers.

$$S = \frac{D}{T} = \frac{10 \text{ km}}{1.5 \text{ hr}} = \boxed{6.67 \text{ km/hr}}$$

3. If a runner maintains a constant speed of 12 miles/hour, how long will it take to complete a half marathon race of 13.1 miles?

$$T = \frac{D}{S} = \frac{13.1 \text{ miles}}{12 \text{ miles/hr}} = \boxed{1.09 \text{ hours}}$$

4. A helium balloon is carried by the wind at a constant speed of 10.17 mph. How far did the balloon travel in one day?

$$D = S \times T \quad 10.17 \text{ mph} \times 24 \text{ hrs}$$

$$a = \frac{v_f - v_i}{t}$$

W

Slowing Down - Negative acceleration (deceleration)

A paperboy rode his bike at 3 m/s. After being chased by a dog for 8 seconds, he was traveling 6 m/s. What is his acceleration?

v_f

$$\frac{6 \text{ m/s} - 3 \text{ m/s}}{8 \text{ s}} = \frac{3 \text{ m/s}}{8 \text{ s}} = \boxed{0.375 \text{ m/s}^2}$$

6. A soccer player is running at 6 m/s. He then stumbles over an opponent's foot falling and rolling to a stop. This took 4 seconds. What was his acceleration?

v_f

$$\frac{0 \text{ m/s} - 6 \text{ m/s}}{4 \text{ s}} = \frac{-6 \text{ m/s}}{4 \text{ s}} = \boxed{-1.5 \text{ m/s}^2}$$

Section 3: Force

$$F = m \cdot A$$

$$m = \frac{F}{A}$$

$$A = \frac{F}{m}$$

1. How much force is needed to accelerate a mass of 160 kg by 2 m/s²?

$$F = m \times A = 160 \text{ kg} \times 2 \text{ m/s}^2 = \boxed{320 \text{ N}}$$

2. How much force is required to accelerate a 5 kg mass at 20 m/s²?

$$F = m \times A = 5 \text{ kg} \times 20 \text{ m/s}^2 = \boxed{100 \text{ N}}$$

3. What is the acceleration of a 10 kg mass pushed by a 5 N force?

$$A = \frac{F}{m} = \frac{5 \text{ N}}{10 \text{ kg}} = \boxed{0.5 \text{ m/s}^2}$$

4. Given a force of 56 N and acceleration of 7 m/s², what is the mass?

$$m = \frac{F}{A} = \frac{56 \text{ N}}{7 \text{ m/s}^2} = \boxed{8 \text{ kg}}$$

5. Find the acceleration of the 2 kg block in the following diagram.

net force is

$$\begin{array}{r} 8 \text{ N} \\ - 4 \text{ N} \\ \hline 4 \text{ N} \end{array}$$

$$A = \frac{F}{m} = \frac{4 \text{ N}}{2 \text{ kg}} = \boxed{2 \text{ m/s}^2}$$

Section 4: Work

$$W = F \times D$$

$$F = \frac{W}{D}$$

$$D = \frac{W}{F}$$

1. A watermelon weighing 10 newton is lifted 2 meters. How much work is done?

$$W = F \times D \quad 10N \times 2m = \boxed{20J}$$

2. A force of 15 newtons is used to push a box along the floor a distance of 3 meters. How much work was done?

$$W = F \times D = 15N \times 3m = \boxed{45J}$$

3. It took 50 joules to push a chair 5 meters across the floor. With what force was the chair pushed?

$$F = \frac{W}{D} = \frac{50J}{5m} = \boxed{10N}$$

4. A force of 100 Newtons was necessary to lift a rock. A total of 150 joules of work was done. How far was the rock lifted?

$$D = \frac{W}{F} = \frac{150J}{100N} = \boxed{1.5m}$$

Section 5 Power

$$P = \frac{W}{T}$$

$$W = P \times T$$

$$T = \frac{W}{P}$$

- ~~1. A mechanic uses a jack to lift a truck and does 7258J of work. If he lifts the truck 45m, what was the power output?~~

~~$$P = \frac{W}{T} = \frac{7258J}{45m} = 161.29W$$~~

NOT Given all variables

2. How much work is done in order to cook a bag of popcorn in a 500-watt microwave oven for 5.5 minutes?

$$W = P \times T \quad 500W \times 5.5min = \boxed{2750J}$$

3. If a runner exerts 350J of work to make 125W of power, then how long did it take the runner to do the work?

$$T = \frac{W}{P} = \frac{350J}{125W} = \boxed{2.8s}$$
